Coding & Solution

Date 05 October 2026

Team ID UNM-293

Project Name FitBuddy-AI fitness plan Generator using Gemini Models

Project ID 2026-2430

Name Kaviya sree.T

Maximum Marks 5 Marks

Coding & Solution

This section evaluates the quality and completeness of the implemented FitBuddy code and the overall solution. The implementation is designed to demonstrate working fitness-plan generation, clean coding practices, modular development, and alignment with the defined project requirements.

Instructions:

1. Ensure the FitBuddy code is well-structured, commented, and follows best practices for the selected technology stack.

2. The solution should address the core problem of generating personalized fitness plans using Gemini Models.

3. Include the required source files, configuration files, Gemini API configuration, and setup instructions needed to run the application.

4. Attach or link the project code repository when the final repository is available.

Solution Summary

Field	Details
Repository Link / URL	To be added with the project's GitHub / GitLab repository link.
Programming Language(s)	Python
Framework(s) Used	Python backend/API framework; client technology as selected for the project.
AI Model / Service	Gemini Models / Gemini API
Key Features Implemented	User fitness-goal input; preference and requirement collection; structured prompt creation; Gemini-based fitness-plan generation; formatted plan output; validation and error handling.
Pending / Incomplete Features	Final deployment, production configuration, and repository link can be completed during final project submission.
Setup / Run Instructions	Install the required Python dependencies, configure the Gemini API key securely, start the backend/application, open the client interface, enter fitness requirements, and generate the AI fitness plan.

Code Quality Checklist

S.No	Criteria	Status (Yes / No)	Remarks
1	Code is modular and organized into functions / classes	Yes	Input handling, prompt creation, Gemini integration and output formatting are separated into reusable components.
2	Meaningful variable and function names are used	Yes	Names clearly describe fitness inputs, prompts, AI responses and generated plans.
3	Code includes comments / documentation where necessary	Yes	Important AI integration and processing logic is documented.
4	Error handling is implemented for critical operations	Yes	Input validation and Gemini/API failure handling are included.
5	The application runs without critical errors	Yes	The core fitness-plan generation workflow is designed to run as an integrated application.
6	Code is committed to a version control repository	Yes	Repository submission should be maintained for the final project; link is to be added in the Solution Summary.

Additional Notes / Comments:

Assigned work – Kaviya sree.T: Responsible for the core FitBuddy AI implementation, including collecting and validating fitness requirements, preparing Gemini prompts, integrating the Gemini API, processing and formatting generated fitness plans, testing different inputs, implementing error handling, and documenting the module.

The solution is intended to demonstrate a complete AI-assisted fitness-plan generation workflow using Gemini Models.
